PROFILE

Computer Science graduate focused on embedded systems, robotics, AI and software engineering. I build tested, maintainable systems across real-time Arduino firmware, machine learning and cross-platform applications.

SELECTED PROJECTS

BIOS Beep Code Analyzer

BSC THESIS · EMBEDDED SYSTEMS

- Designed an Arduino Uno diagnostic device that decodes motherboard beep signals and identifies probable hardware faults on a 128×64 OLED.
- Built ~1,900 lines of C++ firmware using edge detection, dual state machines and BIOS-specific timing; supported AMI, Award and Phoenix and passed 7/7 hardware tests.

Heart Disease Neural Network

ACADEMIC AI PROJECT

- Built a TensorFlow/Keras MLP for binary classification from 13 clinical features in the Cleveland Heart Disease dataset.
- Coursework run reported 95.56% accuracy on a selected 45-sample test split; the public version uses leakage-safe preprocessing and documents limitations.

FoodRush

FULL-STACK & MOBILE PROJECT

- Developed React web and Expo mobile clients sharing a Node.js/Express REST API and LowDB data layer.
- Implemented authentication, checkout, order tracking, geolocation, WebAuthn and mobile biometrics.

Theatre Booking System

DISTRIBUTED MOBILE SYSTEMS

- Built an Expo/React Native booking app with JWT authentication, interactive seat selection, an Express API, MariaDB and transactional conflict protection.

EDUCATION

BSc (Hons) Computer Science

University of East London

2022–2026

All degree requirements completed July 2026. Programme delivered with Metropolitan College, Thessaloniki. Final classification pending.

TECHNICAL SKILLS

Embedded

C/C++, Arduino, finite-state machines, I2C, I2S, signal processing
